Hi Alice,

The technical review has been completed and below is a question for your attention:

1. The limits to which the AC Line conducted measurements were compared are no longer the current limits listed in Section 15.207. This Rule has been amended to bring it into alignment with the CISPR 22 limits. As a result, the lower frequency range for testing is now 150 kHz, and no longer 450 kHz. Pursuant to Section 15.37(j), if the EUT is approved with the current test data, new data demonstrating compliance with the new limits, over the new frequency range, must be submitted by July 10, 2005, or the grant will no longer be valid. A Note Code will be placed on the grant to this effect. Alternatively, a new test, over the required frequency range, may be performed now, with data submitted, so that the grant will remain valid indefinitely, and no such condition will appear on the grant. Please indicate the choice of the applicant in this matter.

Thanks.

Regards,

Marianne
