

EXHIBIT 4
TUNE-UP PROCEDURE

As required by § 2.1033(c)(9), this exhibit describes the procedures used to tune-up or initially prepare the DTSA GSM radio module for operation, in accordance with the regulations governing the operation of personal communications services (PCS) equipment given in Part 24, Subpart E.

Tune-up of the transmitter is performed at both the board and module level and is completed at the factory prior to final assembly of the GSM radio module. DTSA maximum output power is set at the factory and cannot be increased in the field, nor are there any requirements for or capability provided to make transmitter adjustments in the field during installation or operation of the device.

Specific transmitter tune-up procedures are being provided under separate cover by the manufacturer of the GSM radio module.
