**Summary**

Tests for compliance with FCC Regulations subject to Part 15, Subpart B, and with Industry Canada Regulations subject to RSS-210, were performed on Digi-Code Control/Security Receiver, Model CR-5120. This device is subject to FCC Rules and Regulations as a Receiver.

In testing performed on May 8 and 9, 2000, the devices tested in the worst case met the allowed FCC (Class B) specifications for radiated emissions by 4.1 dB (see p. 6). The line conducted emissions, FCC/IC Class B, were met by at least 20 dB.

## 1. Introduction

Digi-Code Receiver, Model CR-5120, was tested for compliance with FCC Regulations, Part 15, adopted under Docket 87-389, April 18, 1989, and with Industry Canada RSS-210, Issue 2, dated February 14, 1998. The tests were performed at the University of Michigan Radiation Laboratory Willow Run Test Range following the procedures described in ANSI C63.4-1992 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The Site description and attenuation characteristics of the Open Site facility are on file with FCC Laboratory, Columbia, Maryland (FCC file 31040/SIT) and with Industry Canada, Ottawa, ON (File Ref. No: IC 2057).

## 2. Test Procedure and Equipment Used

The test equipment commonly used in our facility is listed in Table 2.1 below. The second column identifies the specific equipment used in these tests. The HP 8593E spectrum analyzer is used for primary amplitude and frequency reference.

Table 2.1. Test Equipment.

Test Instrument	Equipment Used	Manufacturer/Model	Cal. Date/By
Spectrum Analyzer (9kHz-22GHz)	X	Hewlett-Packard 8593A SN: 3107A01358	October 1999/UM
Spectrum Analyzer (9kHz-26GHz)	X	Hewlett-Packard 8593E SN: 3107A01131	September 1999/HP
Spectrum Analyzer (0.1-1500 MHz)		Hewlett-Packard 182T/8558B SN: 1529A01114/543592	October 1999/U of M Rad Lab

### 3. Configuration and Identification of Device Under Test

The DUT is a 300 MHz superegenerative receiver, designed for garage door opener applications and is powered from 110VAC line via 24VAC wall plug-in transformer. The receiver is housed in a small plastic case approximately 5 x 3 x 1 inches, having connections for 24VAC and relay control. The antenna is extnal, made of 12 inch solid wire and bent. For testing, a "generic" harness was made up, one bundle containing a pair of power-up wires and another for the relay control output. The length of the harness was about 2.0 m and the ends of signal wires were left open. In the receiver, decoding, signal processing, etc., are performed by a custom chip.

The DUT was designed and manufactured by Digi-Code, 307 Robins Drive, Troy, MI 48083. It is identified as:

Digi-Code Garage Door Opener Receiver  
Model: CR-5120  
SN: TEST5120  
FCC ID: OWMHC-DIGICODE  
CANADA:

Wall Transformer, 120VAC/24VAC(75 mA); (ENG, Model: 35A-24-75)

#### 3.1 Modifications Made

There were no modifications made to the DUT by this laboratory.

### 4. Emission Limits

For FCC the DUT falls under Part 15, Subpart B, "Unintentional Radiators". For Industry Canada the DUT falls under Receiver category and is subject to technical requirement of sections 7.1 to 7.4 in RSS-210. The pertinent test frequencies, with corresponding emission limits, are given in Tables 4.1 and 4.2 below.

#### 4.1 Radiated Emission Limits

Table 4.1. Radiated Emission Limits (FCC: 15.33, 15.35, 15.109; IC: RSS-210, 7.3).

Freq. (MHz)	E <sub>lim</sub> (3m) $\mu$ V/m	E <sub>lim</sub> dB( $\mu$ V/m)
30-88	100	40.0
88-216	150	43.5
216-960	200	46.0
960-2000	500	54.0

Note: Quasi-Peak readings apply to 1000 MHz (120 kHz BW)  
Average readings apply above 1000 MHz (1 MHz BW)

#### 4.2 Conducted Emission Limits

Table 4.2. Conducted Emission Limits (FCC: 15.107; IC: RSS-210, 6.6).

Freq. (MHz)	$\mu$ V	dB( $\mu$ V)
0.450 - 1.705	250	48.0
1.705 - 30.0	250	48.0

Note: Quasi-Peak readings apply here

### 4.3 Antenna Power Conduction Limits

(FCC: 15.111(a); IC: RSS-210, 7.2).  $P_{max} = 2 \text{ nW}$ ; for frequency range see Table 4.1.

## 5. Emission Tests and Results

NOTE: Even though the FCC and/or Industry Canada specify that both the radiated and conductive emissions be measured using the Quasi-Peak and/or average detection schemes, we normally use peak detection since especially the Quasi-Peak is cumbersome to use with our instrumentation. In case the measurement fails to meet the limits, or the measurement is near the limit, it is remeasured using appropriate detection. We note, that since the peak detected signal is always higher or equal to the Quasi-Peak or average detected signal, the margin of compliance may be better, but not worse, than indicated in this report. The type of detection used is indicated in the data table, Table 5.1.

### 5.1 Anechoic Chamber Radiated Emission Tests

To familiarize with the radiated emission behavior of the DUT, it was studied and measured in the shielded anechoic chamber. In the chamber there is a set-up similar to that of an outdoor 3-meter site, with turntable, antenna mast, and a ground plane. Instrumentation includes spectrum analyzers and other equipment as needed.

To study and test for radiated emissions, the DUT was powered by a laboratory power supply at 24VAC. A 300 MHz CW signal was injected (radiated) from a nearby signal generator using a short wire antenna. The DUT was taped to a styrofoam block and placed on the test table on each of the three axis. At each orientation, the table was rotated to obtain maximum signal for vertical and horizontal emission polarizations. This sequence was repeated throughout the required frequency range.

In the chamber we studied and recorded all the emissions using a ridge-horn antenna, which covers 200 MHz to 5000 MHz, up to 2 GHz. In scanning from 30 MHz to 2.0 GHz, there were no spurious emissions observed other than the LO and injection signal (300 MHz), and the LO harmonics. Figures 5.1 and 5.2 show emissions measured 0-1000 MHz and 1000-2000 MHz, respectively. These measurements are made with a ridge-horn antenna at 3m, with spectrum analyzer in peak hold mode and the receiver rotated in all orientations. The measurements up to 1000 MHz (Fig. 5.1) are used for initial evaluation only, but those above 1000 MHz (Fig. 5.2) are used in final assessment for compliance.

### 5.2 Open Site Radiated Emission Tests

The DUT was then moved to the 3 meter Open Field Test Site where measurements were repeated up to 1000 MHz using a small bicone, or dipoles when the measurement is near the limit. The DUT was exercised as described in Sec. 5.1 above. The measurements were made with a spectrum analyzer using 120 kHz IF bandwidth and peak detection mode, and, when appropriate, using Quasi-Peak or average detection (see 5.0). The test set-up photographs are in the Appendix (i.e., end of this report).

The emissions from digital circuitry were measured using a standard bicone. These results are also presented in Table 5.1.

### 5.3 Computations and Results for Radiated Emissions

To convert the dBm's measured on the spectrum analyzer to  $\text{dB}(\mu\text{V/m})$ , we use expression

$$E_3(\text{dB}\mu\text{V/m}) = 107 + P_R + K_A - K_G$$

where  $P_R$  = power recorded on spectrum analyzer, dB, measured at 3m  
 $K_A$  = antenna factor, dB/m  
 $K_G$  = pre-amplifier gain, including cable loss, dB

When presenting the data, at each frequency the highest measured emission under all of the possible orientations is given. Computations and results are given in Table 5.1. There we see that the DUT meets the limit by 4.1 dB.

#### **5.4 Conducted Emission Tests**

The DUT is powered by Direct Plug-in Transformer, 120VAC/24VAC(75 mA). (ENG, Model: 35A-24-75). The DUT was tested for Line Conducted Emissions in the standard FCC/IC LISN set-up. There were no measurable emissions from the DUT, i.e., it passed the Class B limit by at least 20 dB.

### **6. Other Measurements**

#### **6.1 Emission Spectrum Near Fundamental**

Near operating frequency the emission spectrum is measured typically over 50 MHz span with and without injection signal. These data are taken with the DUT close to antenna and hence amplitudes are relative. The plots are shown in Figure 6.1.

#### **6.2 Effect of Supply Voltage Variation**

The DUT has been designed to operate from 120VAC line. Using a spectrum analyzer, relative radiated emissions were recorded at the "fundamental" (310 MHz) as voltage was varied from 59 to 140 VAC. Figure 6.2 shows the emission variation.

#### **6.3 Operating Voltage and Current**

$$\begin{aligned} V &= 120.0 \text{ VAC} \\ I &= 17.6 \text{ mA} \end{aligned}$$
