1.5 PRODUCT INFORMATION

1.5.1 Technical Description

The Equipment Under Test (EUT) RRUS 01 B5, KRC 118 70/2 is an Ericsson Radio Equipment working in the public mobile service 850MHz band which provides communication connections to 850 network in GSM / WCDMA / LTE Modes and GSM & WCDMA / GSM & LTE / WCDMA & LTE MSR modes. The RRUS 01 B5, KRC 118 70/2 operates from a -48V DC supply.

By combining two EUTs together, the EUTs were configured to transmit in MIMO mode with two TX/RX ports (RF A1, RF A2) and two RX ports (RF B1, RF B2). MIMO mode was used for measurements as the worst configuration.

The Maximum Output Power was tested on both TX/RX output connector RF A1 and RF A2, all other TX measurements were performed on the combined TX/RX output connector RF A1 of the EUT as the representative port.

The complete testing was performed with the EUT transmitting at maximum RF power unless otherwise stated.

The Equipment Under Test (EUT) is shown in the photograph below. A full technical description can be found in the Manufacturer's documentation.

1.7 TEST CONDITIONS

For all tests the EUT was set up in accordance with the relevant test standard and to represent typical operating conditions. Tests were applied with the EUT situated in a shielded enclosure, test laboratories or a chamber as appropriate.

The EUT was powered from a -48V DC supply.

1.8 DEVIATION FROM THE STANDARD

No deviations from the applicable test standards or test plan were made during testing.

1.9 MODIFICATION RECORD

Modification State 0 - No modifications were made to the EUT during testing.

1.10 ALTERNATIVE TEST SITE

Under our group UKAS Accreditation, TÜV SÜD Product Service conducted the following tests at Ericsson in Beijing, China:

- Maximum Peak Output Power and Peak to Average Ratio – Conducted
- Occupied Bandwidth
- Band Edge
- Conducted Spurious Emissions
- Frequency Stability

Only Radiated Spurious Emissions testing has been performed under the following site registrations:

2.1.5 Environmental Conditions

Ambient Temperature	23.0 – 24.5°C
Relative Humidity	22.0 – 24.5%

2.1.6 Test Method

The test was applied in accordance with the test method requirements of FCC Part 22 and Industry Canada RSS-132.

Using a power meter and attenuator(s), the output power of the EUT was measured at the antenna terminal. The EUT was configured to transmit on maximum power on the configurations defined in the tables below. Since the EUT transmits on two antennas simultaneously in the same frequency range for MIMO devices, i.e., TX MIMO mode, using the Measure-and-Sum approach, the output power at both antennas were tested, and the total output power were then summed mathematically in linear power units According to FCC KDB 662911 D01.

A peak to average ratio measurement is performed at the conducted ports of the EUT for single carrier of single RAT mode. The spectrum analysers Complementary Cumulative Distribution Function (CCDF) were used and 0.1% probability value recorded.

The RMS Power and Peak to Average Ratio was measured and recorded with the results being compared with the limits.

2.1.7 Test Results

Note:

This unit is tested without antenna. ERP/EIRP compliance is addressed at the time of licensing, as required by the responsible IC Bureau(s). Licensees are required to take into account maximum allowed antenna gain used in combination with above power settings to prevent the radiated output power to exceed the limits.

2.2.5 Environmental Conditions

Ambient Temperature	22.5 – 24.5°C
Relative Humidity	21.0 – 24.5%

2.2.6 Test Method

The test was applied in accordance with the test method requirements of FCC Part 22 and Industry Canada RSS-132.

The EUT was set to transmit at maximum power and testing was carried out on Bottom, Middle and Top Channels. Using the Occupied Bandwidth measurement function in the Spectrum Analyser, the Occupied Bandwidth is defined as the width of the signal between two points, one below the carrier centre frequency and one above the carrier centre frequency. For IC requirement, the 99% Occupied Bandwidth was measured. For FCC requirement, outside of which all emissions are attenuated by at least X dB below the transmitter power, where the value of X is typically specified as 26. The -26dBc Occupied Bandwidth was measured from each antenna port in accordance with FCC KDB 971168 D01 v02r01.

The results are shown in the plots below.

2.3.5 Environmental Conditions

Ambient Temperature	23.0 - 24.5°C
Relative Humidity	22.0 - 24.5%

2.3.6 Test Method

The test was applied in accordance with the test method requirements of FCC Part 2 and Part 22 and Industry Canada RSS-132.

In accordance with FCC CFR 47 Part 22, Clause 22.917 (b) and Industry Canada RSS-132, Clause 5.5, any emissions outside of the block edges shall be attenuated by at least $43 + 10 \log(P)$. In the 1MHz bands immediately outside and adjacent to the frequency block, a resolution bandwidth of at least 1% of the emission bandwidth should be used.

For measurements of emissions > 1MHz away from the band edges, a RBW of 100KHz or greater should be used. the limit is -13dB.

For MIMO mode configurations, the limit was adjusted with a correction of -3dB $[10\log(2)]$ by using the Measure and Add $10\log(N)$ dB technique according to FCC KDB662911 D01 accounting for simultaneous transmission from antennas port RF A1 and RF A2.

The path loss measured and entered as a reference level offset. The EUT was set to transmit at its maximum rated output power in the configurations described in the tables below. Measurements were made at the Top and Bottom of the band.

The results are shown in the plots below.

2.4.5 Environmental Conditions

Ambient Temperature	25.0 – 26.5°C
Relative Humidity	26.5 – 30.0%

2.4.6 Test Method

The test was applied in accordance with the test method requirements of FCC CFR 47 Part 2 and Part 22 and Industry Canada RSS-132 and ANSI/TIA-603-C-2004.

A preliminary profile of the Spurious Radiated Emissions was obtained by operating the EUT on a remotely controlled turntable within the chamber. Measurements of emissions from the EUT were obtained with the Measurement Antenna in both Horizontal and Vertical Polarisations.

The measurement of radiated spurious emissions in the frequency range 30MHz to 10GHz was performed using a peak detector and a resolution bandwidth of 100 kHz which satisfied the minimum measurement bandwidth requirement of 100 kHz.

The EUTs were measured with the antenna height varied between 1 and 4 m with the turntable rotated between 0 and 360 degrees. The unwanted emissions of any frequencies within 10dB of the limit were measured with the substitution method used according to the standard.

The measurements were performed at a 3m distance unless otherwise stated

The limit for Spurious Emissions have been calculated, as shown below using the following formula:

Field Strength of Carrier - $(43 + 10\log(P))$ dB

Where:

Field Strength is measured in dB μ V/m

P is measured Transmitter Power in Watts

Determination of Spurious Emission Limit

As the EUT does not have an integral antenna, the field strength of the carrier has been calculated assuming that the power is to be fed to a half-wave tuned dipoles as per 2.1053 (a).

$$E_{(v/m)} = (30 \times G_i \times P_o)^{0.5} / d$$

Where G_i is the antenna gain of ideal half-wave dipoles,
 P_o is the power out of the transceiver in W,
 d is the measurement distance in meter.

Therefore at 3m measurement distance the field strength using the lowest transceiver output power would be:

$$E_{(v/m)} = (30 \times 1.64 \times 82.60)^{0.5} / 3 = 21.25V/m = 146.54dB\mu V / m$$

As per 22.917 (a) the spurious emission must be attenuated by $43 + 10\log(P_o)$ dB this gives:

$$43 + 10\log(82.60) = 62.17dB$$

Therefore the limit at 3m measurement distance is:

$$146.54 - 62.17 = 84.4 \text{ dB}\mu V/m$$

This limit has been used to determine Pass or Fail for the harmonics measured and detailed in the following results.

The results are shown in the plots below.

Ambient Temperature	23.0 – 24.5°C
Relative Humidity	22.0 – 24.5%

2.5.6 Test Method

The test was applied in accordance with the test method requirements of FCC Part 2 and Part 22 and Industry Canada RSS-132.

In accordance with FCC CFR 47 Part 2, Clause 2.1051, the spurious emissions from the antenna terminal were measured. In accordance with FCC CFR 47 Part 22, Clause 22.917(a) and Industry Canada RSS-132, Clause 5.5, any emissions outside of the block edges shall be attenuated by at least $43 + 10 \log (P)$.

The EUT was set to transmit at its maximum rated output power. The path loss between the Spectrum Analyser and the EUT was measured with the worst case level being entered as a Reference Level Offset. In accordance with 22.917(a), the RBW was set to 100 kHz and a Peak detector with the trace set to Max Hold was used as the worst case. The frequency spectrum was then investigated between 9kHz and 9GHz. Testing was carried out on the Bottom, Middle and Top channels.

For MIMO mode configurations, the limit was adjusted with a correction of -3dB [10Log2] by using the Measure and Add 10Log(N) dB technique according to FCC KDB662911 D01 accounting for simultaneous transmission from antenna ports RF A1 and RF A2.

The measurements were performed on the output connector RF A1. Limited complementary measurement were done at output connector RF A2 to verify identical performance for both transmitter chains in MIMO mode

The results are shown in the plots below.

2.6.4 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.6.5 Environmental Conditions

Ambient Temperature	22.5 - 24.0°C
Relative Humidity	26.5 - 27.5%

2.6.6 Test Method

Frequency Error – Temperature Variation

The EUT was tested over the temperature range -30°C to +50°C in 10°C steps with -48 VDC Power Supply. At each temperature step, the Base Station was configured to transmit an [RAT]* at maximum power on the middle channel of the operating band. After achieving thermal balance, the averages of 200 transmission bursts were measured and the result recorded.

Frequency Error – Voltage Variation

The EUT was tested at the supplied voltages varied from 85 to 115 percent of the nominal values of both -48 VDC power supplies. At +20°C and each voltage extreme, the Base Station was configured to transmit an [RAT]* at maximum power on the middle channel of the operating band. The average of 200 transmission bursts was measured and the result recorded.

[RAT]* WCDMA – Single Carrier with QPSK modulation
LTE (5.0 MHz OBW) – Single Carrier with QPSK modulation
