# **Engineering Statement**

#### 1 Introduction

Intelsat License LLC ("Intelsat") seeks authority in this application to operate the satellite designated as Intelsat 9 (Call Sign S2380), at 66.15° E.L. The characteristics of the Intelsat 9 spacecraft, as well as its compliance with the various provisions of Part 25 of the Federal Communications Commission's ("FCC" or "Commission") rules, are provided in this Engineering Statement, which also updates the beam gain contours. In all other respects, the characteristics of Intelsat 9 are the same as those described in SAT-MOD-20161110-00105.

## 2 Spacecraft Overview

Intelsat 9 is a Boeing model 601HP spacecraft capable of operating in the C-band and Ku-band frequencies listed below and will provide service to Asia, Europe, and North Africa.

Direction	Frequency
Unlink	5925 – 6425 MHz
Uplink	14000 – 14500 MHz
Downlink	3700 – 4200 MHz
	11450 – 11700 MHz
	11700 – 12200 MHz <sup>1</sup>

# 2.1 Spacecraft Characteristics

Intelsat 9 is a Boeing model BS601HP three-axis stabilized type spacecraft that has a rectangular outer body structure. Intelsat 9 utilizes two deployable solar array wings and a number of deployable and non-deployable antennas.

The Intelsat 9 spacecraft is composed of the following subsystems:

- Thermal;
- Power;
- Attitude Control;
- Propulsion;
- Telemetry, Command and Ranging;
- Uplink Power Control; and
- Communications.

<sup>&</sup>lt;sup>1</sup> Operations in 11700-12200 MHz at 66.15° E.L. will be in Regions 1 and 3 only.

These subsystems maintain the correct position and attitude of the spacecraft; ensure that all internal units are maintained within the required temperature range; and ensure that the spacecraft can be commanded and controlled with a high level of reliability from launch to the end of its useful life. The spacecraft design incorporates redundancy in all of the various subsystems in order to avoid single-point failures.

The structural design of Intelsat 9 provides mechanical support for all subsystems. The structure supports the communication antennas, solar arrays, and thrusters. It also provides a stable platform for preserving the alignment of critical elements of the spacecraft.

#### 2.2 Communication Subsystem

Intelsat 9 provides active communication channels at C-band frequencies, each having a bandwidth of 36 MHz, and Ku-band frequencies each having a bandwidth of 36 MHz. The Intelsat 9 frequencies, polarization, and channel plan are provided in the Schedule S. An explanation of how uplink frequency bands are connected to downlink frequency bands is provided in Exhibit 5.

The coverage contours and performance characteristics of all Intelsat 9 beams except for the global beams are provided in the Schedule S. The global beams have gain contours that vary by less than 8 dB across the surface of the Earth and, accordingly, the gain at 8 dB below the peak falls beyond the edge of the Earth. Therefore, pursuant to Section 25.114(c)(4)(vi)(A) of the FCC's rules, contours for these beams are not required to be provided and the associated GXT files have not been included in Schedule S. Intelsat has included the Schedule S beam designation for all beams in Exhibit 1. Exhibits 2 and 3 provide the beam parameters for the Intelsat 9 uplink and downlink beams, respectively.

#### 2.3 Telemetry, Command and Ranging Subsystem

The telemetry, command and ranging ("TC&R") subsystem provides the following functions:

- Acquisition, processing and transmission of spacecraft telemetry data;
- Reception and retransmission of ground station generated ranging signals; and
- Reception, processing and distribution of telecommands.

The Intelsat 9 command and telemetry channel frequencies are shown in Exhibit 4. The coverage patterns of the command and telemetry beams have gain contours that vary by less than 8 dB across the surface of the Earth, and accordingly the gain at 8 dB below the peak falls beyond the edge of the Earth. Therefore, pursuant to Section 25.114(c)(4)(vi)(A) of the FCC's rules, contours for these beams are not required to be provided and the associated GXT files have not been included in Schedule S. The Intelsat 9 command and telemetry subsystem performance is summarized in Exhibit 4.

### 2.4 Uplink Power Control Subsystem

Intelsat 9 utilizes two Ku-band channels for uplink power control ("ULPC"), antenna tracking, and ranging. The coverage patterns of the ULPC beams have gain contours that vary by less than 8 dB across the surface of the Earth, and accordingly the gain at 8 dB below the peak falls beyond the edge of the Earth. Therefore, pursuant to Section 25.114(c)(4)(vi)(A) of the FCC's rules, contours for these beams are not required to be provided and the associated GXT files have not been included in Schedule S. The Intelsat 9 ULPC frequencies and subsystem performance are summarized in Exhibit 4.

#### 2.5 Satellite Station-Keeping

The spacecraft will be maintained within 0.05° of its nominal longitudinal position in the east-west direction. Accordingly, it will comply with Section 25.210(j) of the Commission's rules.

The attitude of the spacecraft will be maintained with accuracy consistent with the achievement of the specified communications performance, after taking into account all error sources (i.e., attitude perturbations, thermal distortions, misalignments, orbital tolerances, and thruster perturbations, etc.).

#### 3 Services

Intelsat 9 is a general purpose communications satellite and has been designed to support various services offered within the Intelsat satellite system. Depending upon the needs of the users, the transponders on Intelsat 9 can accommodate television, radio, voice, and data communications. Typical communication services include:

- Compressed digital video;
- High speed digital data; and
- Digital single channel per carrier ("SCPC") data channels.

## 4 Power Flux Density

The power flux density ("PFD") limits for space stations operating in the 3700 – 4200 MHz and 11450 –11700 MHz bands are specified in Section 25.208 of the Commission's rules. There are no PFD limits specified for the 11700 – 12200 MHz band in either Section 25.208 of the Commission's rules or No. 21.16 of the International Telecommunication Union ("ITU") Radio Regulations. The maximum PFD levels for the Intelsat 9 transmissions were calculated for the 3700 – 4200 MHz and 11450 – 11700 MHz bands. The results are provided in Schedule S and show that the downlink power flux density levels of the Intelsat 9 carriers do not exceed the limits specified in Section 25.208 of the Commission's rules or the limits specified in No. 21.16 of the ITU Radio Regulations.

### **5** Emission Compliance

Section 25.202(e) of the Commission's rules requires that the carrier frequency of each space station transmitter be maintained within 0.002% of the reference frequency. Intelsat 9 is designed to be compliant with the provisions of this rule.

Intelsat will comply with the provisions of Section 25.202(f) of the Commission's rules with regard to Intelsat 9's emissions.

#### 6 Orbital Location

Intelsat requests that it be assigned the 66.15° E.L. orbital location for Intelsat 9. The 66.15° E.L. location satisfies Intelsat 9 requirements for optimizing coverage, elevation angles, and service availability. Additionally, the location also ensures that the maximum operational, economic, and public interest benefits will be derived.

### 7 ITU Filings

Intelsat 9's operations in the 3700 – 4200 MHz, 5925 – 6425 MHz, 11450 – 11700 MHz, and 14000 – 14500 MHz frequency bands have been notified under the Administration of the United States' International Telecommunication Union ("ITU") filings INTELSAT7 66E and INTELSAT9 66E.

Intelsat 9's operation in the 11700 – 12200 MHz frequency band has been notified under the Administration of the United Kingdom's ITU filing Intelsat KUEXT 66E.

Intelsat respectfully requests that the United States Administration state its non-objection to the United Kingdom's use of Intelsat 9 for purposes of bringing back into use and maintaining the United Kingdom's Intelsat KUEXT 66E filing.

#### **8 Coordination Statement and Certifications**

The downlink EIRP density of Intelsat 9 transmissions in the conventional C-band will not exceed 3 dBW/4kHz for digital transmissions or 8 dBW/4kHz for analog transmissions, and associated uplink transmissions will not exceed applicable EIRP density envelopes in Sections 25.218 or 25.221(a)(1) unless the non-routine uplink and/or downlink operation is coordinated with operators of authorized co-frequency space stations at assigned locations within six degrees of Intelsat 9 at 66.15° E.L.

The downlink EIRP density of Intelsat 9 transmissions in the conventional or extended Ku-bands will not exceed 14 dBW/4kHz for digital transmissions or 17 dBW/4kHz for analog transmissions, and associated uplink transmissions will not exceed applicable EIRP density envelopes in Sections 25.218, 25.222(a)(1), 25.226(a)(1), or 25.227(a)(1) unless the non-routine uplink and/or downlink operation is coordinated with operators of authorized co-frequency space stations at assigned locations within six degrees of Intelsat 9 at 66.15° E.L.

## 9 Orbital Debris Mitigation Plan

Intelsat is proactive in ensuring safe operation and disposal of this and all spacecraft under its control. The four elements of debris mitigation are addressed below.

#### 9.1 Spacecraft Hardware Design

The spacecraft is designed such that no debris will be released during normal operations. Intelsat has assessed the probability of collision with meteoroids and other small debris (<1 cm diameter) and has taken the following steps to limit the effects of such collisions: (1) critical spacecraft components are located inside the protective body of the spacecraft and properly shielded; and (2) all spacecraft subsystems have redundant components to ensure no single-point failures. The spacecraft does not use any subsystems for end-of-life disposal that are not used for normal operations.

#### 9.2 Minimizing Accidental Explosions

Intelsat has assessed the probability of accidental explosions during and after completion of mission operations. The spacecraft is designed in a manner to minimize the potential for such explosions. Propellant tanks and thrusters are isolated using redundant valves and electrical power systems are shielded in accordance with standard industry practices. At the completion of the mission and upon disposal of the spacecraft, Intelsat will ensure active units are turned off. Due to the design of Intelsat 9, Intelsat will not be able to vent all pressurized systems. Upon disposal Intelsat will vent the fuel and Oxidizer tanks; the Xenon propellant on Intelsat 9 has already been completely vented. However, because of the spacecraft design, Intelsat will not be able to vent two helium tanks on Intelsat 9. Intelsat notes that the Satellite Industry Association's pending request for blanket waiver of Section 25.283(c) includes the Intelsat 9 satellite. *See* Satellite Industry Association, Request for Blanket Waiver of Section 25.283(c) of the Commission's Rules, IB Docket No. 02-54 (Oct. 1, 2010).

#### 9.3 Safe Flight Profiles

Intelsat has assessed and limited the probability of the space station becoming a source of debris as a result of collisions with large debris or other operational space stations. Subject to receipt of FCC approval, Intelsat 9 will be drifted to 66.15° E.L.

Intelsat is not aware of any other FCC-licensed system, or any other system applied for and under consideration by the FCC, that will have an overlapping station-keeping volume with Intelsat 9 at 66.15° E.L. Intelsat is also not aware of any system with an overlapping station-keeping volume with Intelsat 9 that is the subject of an ITU filing and that is either in orbit or progressing towards launch.

#### 9.4 Post Mission Disposal

At the end of the mission, Intelsat intends to dispose of the spacecraft by moving it to an altitude of at least 150 kilometers above the geostationary arc. Intelsat has reserved 36.1 kilograms of fuel for this purpose. In its *Second Report and Order* in IB Docket 02-54, Mitigation of Orbital

Debris,<sup>2</sup> the FCC declared that satellites launched prior to March 18, 2002, such as the Intelsat 9 satellite, would be designated as grandfathered satellites not subject to a specific disposal altitude. Therefore, the planned disposal orbit for Intelsat 9, as revised, complies with the FCC's rules.

The reserved fuel figure was determined by the spacecraft manufacturer and provided for in the propellant budget. This figure was calculated taking into account the expected mass of the satellite at the end of life and the required delta-velocity to achieve the desired orbit. The fuel gauging uncertainty has been taken into account in these calculations.

#### 10 TC&R Control Earth Stations

Intelsat will conduct TC&R operations through one or more of the following earth stations: Fuchsstadt, Germany; Hartebeeshoek, South Africa; or Fucino, Italy. Additionally, Intelsat is capable of remotely controlling Intelsat 9 from its facilities in McLean, VA or in Long Beach, CA.

Mitigation of Orbital Debris, Second Report and Order, 19 FCC Rcd 11567 (2004).

# **Certification Statement**

I hereby certify that I am a technically qualified person and am familiar with Part 25 of the Commission's rules. The contents of this engineering statement were prepared by me or under my direct supervision and to the best of my knowledge are complete and accurate.
