ANALYSIS OF NON-IONIZING RADIATION
FOR A 6.1M VERTEX 6GHZ BAND EARTH STATION

This report analyzes the non-ionizing radiation levels for an earth station antenna. The OET Bulletin 65, Edit. 97-01, August 1997, Evaluating Compliance with FCC Guidelines for Human Exposure to Radio frequency Electromagnetic Fields specifies that the maximum level of non-ionizing radiation that a person may be exposed to cover a six minute period is an average power density equal to 5 mw/cm2 in a controlled environment. For the general population, a person may be exposed to cover a thirty minute period is an average power density equal to 1mw/cm2 in an uncontrolled environment. It is the purpose of this report to determine the power flux densities of the earth station surface area, in the near field, transition region and far field.

P=Antenna Power(watts), G=Antenna Gain(db), D=Antenna Diameter(meters)
F=Ctr Frequency(ghz), Wl=WaveLength(meters)

Antenna Surface(m2) $A=3.14*D^2/4$
Antenna Surface Density(w/m2) $Ss=4*P/A$

Wavelength Wl(m)= $3/(F*10)$
Near Field Region $Rnf(m)=D^2/(4*Wl)$

Near Field Region Density $Snf(m/m^2)=16*.6*P/(3.14*D^2)$

Transition Region $Rff(m)=.6*d^2/Wl$
Transition Region Density $St(w/m^2)=Snf*Rnf/Rff$

Far Field Region $Sff(m)=P*G/(4*3.14*Rff)$
