Re: **Application for Modification of Earth Station Authorization – Clifton, TX  
GUSA Licensee LLC – Call Sign E970199**

Dear Mr. Sullivan:

Pursuant to Section 25.117 of the Commission’s rules, GUSA Licensee LLC (together with its parent Globalstar, Inc., “Globalstar”) hereby requests authority to modify Globalstar’s feeder link earth station antenna operating in Clifton, Texas, under call sign E970199.<sup>1</sup> Under the proposed modification, Globalstar would operate its second-generation earth station antenna under this call sign. Globalstar is installing second-generation gateway feeder link antennas at its Clifton facility and its other U.S. gateway locations over the next one to two years. In addition, Globalstar proposes to use this second-generation gateway antenna to transmit a new waveform over its global mobile satellite service (“MSS”) network. Globalstar hopes to use this waveform to improve and augment its safety-of-life MSS offerings.

Grant of permanent authority for Globalstar’s second-generation antenna operations will yield significant operational benefits for its MSS network. Globalstar’s second-generation earth station antennas are 6-meter dishes with radomes, manufactured by Cobham SATCOM. These antennas will be more efficient than Globalstar’s existing transceivers, requiring less power and only minimal maintenance. These second-generation facilities will also provide superior satellite-tracking capability, relying on state-of-the-art auto-track technology.

As required by the Commission’s rules, Globalstar provides the relevant technical parameters of its second-generation antenna in the instant application.<sup>2</sup> Globalstar’s second-

---

<sup>1</sup> 47 C.F.R. § 25.117.

<sup>2</sup> As indicated in the instant application, Globalstar is moving its remote control point location to Covington, Louisiana (*see* Schedule B, E61-E68 of FCC Form 312).

generation antennas are similar to its current gateway systems from an RF perspective and comply with all applicable Commission regulations. Authorization of Globalstar's second-generation earth station antenna would result in a slight increase in total EIRP for operations under call sign E970199. Specifically, as indicated in Schedule B, E40 of FCC Form 312 and in Attachment 2 to Globalstar's response to Schedule B, E15, total EIRP under this license would increase from 68.0 dBW to 68.4 dBW.

Globalstar's proposed, modified gateway antenna in Clifton will support all the carriers that are currently supported by its existing Clifton gateway facilities. In addition, as indicated above, Globalstar seeks permanent authority to use this proposed earth station antenna to transmit a new waveform over its MSS network. Globalstar is currently transmitting this waveform from this gateway antenna (call sign E970199) on a temporary basis.<sup>3</sup> Use of this waveform will enhance Globalstar's safety-of-life MSS offerings.

Globalstar provides the relevant technical parameters for its transmission of this waveform in its response to Schedule B, Question 50 of FCC Form 312. This new waveform is a burst mode packet data carrier that will support short-messaging data services. The channel bandwidth for this waveform is 4.5 megahertz at 5096-5250 MHz and 200 kilohertz at 6900-7055 MHz.<sup>4</sup> Transmission of the new waveform creates no greater potential for interference than Globalstar's existing operations at 5091-5250 MHz/6875-7055 MHz.

---

<sup>3</sup> See FCC File No. SES-STA-20200804-00822; *Satellite Communications Services Information re: Actions Taken*, Public Notice, Report No. SES-02301 at 72 (Sep. 16, 2020). On October 27, 2020, Globalstar submitted a request for a 60-day extension of its existing Special Temporary Authority ("STA") for call sign E970199, and in that request also sought authority to commence operating one of its new second-generation feeder link earth station antennas under this call sign during the 60-day STA extension period. See Application of GUSA Licensee LLC for Special Temporary Authority, FCC File No. SES-STA-20201027-01197 (filed Oct. 27, 2020). This STA extension request remains pending.

<sup>4</sup> The proposed transmit emission designator for the new waveform at 5096-5250 MHz under call sign E970199 is 4M50G7D, while the proposed receive emission designators for the new waveform at 6900-7055 MHz are 200KG7D, 230KG7D, and 280KG7D. See Schedule B, E50 of FCC Form 312. The addition of three receive emission designators will permit flexible implementation of this new carrier.

Globalstar also proposes to add a new receive emission designator to its authorization under antenna call sign E970199, for receive-only simplex/SPOT services (emission designator 2M50G7D). *Id.*

Expeditious grant of the instant amended modification application will produce substantial benefits for Globalstar's MSS network and further the public interest. Please do not hesitate to contact me with any questions.

Respectfully submitted,

/s/ Stephen J. Berman
