COMSAT CORPORATION/COMSAT WORLD SYSTEMS

Ms. Magalie Salas
Secretary
Federal Communications Commission
445 12th Street, S.W.
Washington, D.C. 20554

RE: Request for Special Temporary Authority
Paumalu, Hawaii earth station
Call Sign: KA-25

Dear Ms. Salas:

COMSAT Corporation (COMSAT) herein requests a grant of Special Temporary Authority from February 9, 2002 through March 8, 2002, to provide LEOP (launch and early orbit phase) services by the above-referenced earth station in support of the upcoming launch of the INTELSAT 904 satellite, currently scheduled for February 9, 2002. In support of its request, COMSAT submits the following information.

COMSAT uses this earth station in conjunction with its other licensed earth stations at Clarksburg, Maryland to support certain satellite launches. COMSAT herein requests a grant of Special Temporary Authority to permit it to provide LEOP services in support of the INTELSAT 904 launch via the above-referenced earth station.

COMSAT is attaching hereto detailed technical information which demonstrates that the provision of LEOP services by the above-referenced earth station will be compatible with its electromagnetic environment and will not cause harmful interference into any lawfully operated earth station. In the extremely unlikely event that such interference is caused, COMSAT will take all reasonable steps to eliminate the interference.

COMSAT will coordinate the frequency and power usage with **all, existing satellites in-orbit**, which use **the same** frequency bands, and are in the INTELSAT 904's path. COMSAT will also provide all other satellite operators in that path with an emergency phone number where the licensee or its operators can be immediately contacted in the event that harmful interference occurs. Again, in the extremely unlikely event that such interference is caused, COMSAT will take all reasonable steps to eliminate the interference.

A request of Special Temporary Authority will enable COMSAT to provide LEOP services that are critical to placing and maintaining the INTELSAT 904 spacecraft in its proper orbit at 60 degrees E.L. and will thereby promote the public interest.

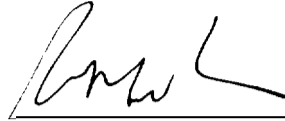

Respectfully submitted,
COMSAT Corporation

By 
Robert A. Mansbach

TABLE OF CONTENTS

1. CONCLUSIONS
2. SUMMARY OF RESULTS
3. SUPPLEMENTAL SHOWING, RE: PART 25.203(C)
4. EARTH STATION COORDINATION DATA
5. CERTIFICATION

1. CONCLUSIONS

AN INTERFERENCE STUDY CONSIDERING ALL EXISTING, PROPOSED AND PRIOR COORDINATED MICROWAVE FACILITIES WITHIN THE COORDINATION CONTOURS OF THE PROPOSED EARTH STATION DEMONSTRATES THAT THIS SITE WILL OPERATE SATISFACTORILY WITH THE COMMON CARRIER MICROWAVE ENVIRONMENT. FURTHER, THERE WILL BE NO RESTRICTIONS OF ITS OPERATION DUE TO INTERFERENCE CONSIDERATIONS.

2. SUMMARY OF RESULTS

A NUMBER OF GREAT CIRCLE INTERFERENCE CASES WERE IDENTIFIED DURING THE INTERFERENCE STUDY OF THE PROPOSED EARTH STATION. EACH OF THE CASES WHICH EXCEEDED THE INTERFERENCE OBJECTIVE ON A LINE-OF-SIGHT BASIS WAS PROFILED AND THE PROPAGATION LOSSES ESTIMATED USING NBS TN101 (REVISED) TECHNIQUES. THE LOSSES WERE FOUND TO BE SUFFICIENT TO REDUCE THE SIGNAL LEVELS TO ACCEPTABLE MAGNITUDES IN EVERY CASE.

THE FOLLOWING COMPANIES REPORTED POTENTIAL GREAT CIRCLE INTERFERENCE CONFLICTS WHICH DID NOT MEET THE OBJECTIVES ON A LINE-OF-SIGHT BASIS. WHEN OVER-THE-HORIZON LOSSES ARE CONSIDERED ON THE INTERFERING PATHS, SUFFICIENT BLOCKAGE EXISTS TO NEGATE HARMFUL INTERFERENCE FROM OCCURRING WITH THE PROPOSED TRANSMIT AND RECEIVE EARTH STATION.

COMPANY

TUNDRA COMMUNICATIONS, INC
VERIZON HAWAII, INC
AT&T WIRELESS SERVICES OF HAWAII, INC

NO OTHER CARRIERS REPORTED POTENTIAL INTERFERENCE CASES.

3. SUPPLEMENTAL SHOWING
RE: PART 25.203(C)

PURSUANT TO PART 25.203(C) OF THE FCC RULES AND REGULATIONS,
THE SATELLITE EARTH STATION PROPOSED IN THIS APPLICATION
WAS COORDINATED BY COMSEARCH USING COMPUTER TECHNIQUES
AND IN ACCORDANCE WITH PART 25 OF THE FCC RULES AND
REGULATIONS.

EXPEDITED COORDINATION DATA FOR THIS EARTH STATION WAS
FAXED TO THE BELOW LISTED CARRIERS WITH A LETTER DATED
MAY 9, 2001.

RADIATION HAZARD STUDY

Analysis of Non-Ionizing Radiation
for a 19.0 Meter Earth Station System

This report analyzes the non-ionizing radiation levels for a 19.0 meter earth station system. The analysis and calculations performed in this report are in compliance with the methods described in the FCC Office of Engineering and Technology Bulletin, No. 65 first published in 1985 and revised in 1991 in Edition 97-01. The radiation safety limits used in the analysis are in conformance with the FCC R&O 96-326. Bulletin No. 65 and the R&O specifies that there are two separate tiers of exposure limits that dependant on the situation in which the exposure takes place and/or status of the individuals who are subject to the exposure. The Maximum Permissible Exposure (MPE) limits for persons in a General Population Uncontrolled environment are shown in Table 1. The General Population Uncontrolled MPE is a function of transmit frequency and is for an exposure period of thirty minutes or less. The MPE limits for persons in an Occupational/Controlled environment are shown in Table 2. The Occupational MPE is a function of transmit frequency and is for an exposure period of minutes or less. The purpose of the analysis described in this report is to determine the power flux density levels of the earth station in the far-field, near-field, transition region, between the subreflector and main reflector surface, at the main reflector surface, and between the antenna edge and the ground and to compare these levels to the specified MPEs.

Table 1. Limits for General Population/Uncontrolled Exposure(MPE)

| Frequency Range (MHz) | Power Density (mWatts/cm**2) |
|-----------------------|------------------------------|
| 30-300 | 0.2 |
| 300-1500 | Frequency(MHz) * (0.8/1200) |
| 1500-100,000 | 1.0 |

Table 2. Limits for Occupational/Controlled Exposure(MPE)

| Frequency Range (MHz) | Power Density (mWatts/cm**2) |
|-----------------------|------------------------------|
| 30-300 | 1.0 |
| 300-1500 | Frequency(MHz) * (4.0/1200) |
| 1500-100,000 | 5.0 |

Table 3 contains the parameters that are used to calculate the various power densities for the earth stations.

Table 3. Formulas and Parameters Used for Determining 'Power Flux Density

| Parameter | Abbreviation | Value | Units |
|-----------------------|--------------|------------------------------|-----------|
| Antenna Diameter | D | 19.0' | meters |

| Antenna Gain | Ges | 59.2 | dBi |
| Pi | II | 3.1415927 | n/a |
| Antenna Efficiency | n | 0.55 | n/a |

1. Far Field Distance Calculation

The distance to the beginning of the far field can be determined from the following equation:(1)

$$\begin{aligned} \text{Distance to the Far Field Region, (Rf)} &= 0.60 * D^{**2} / \text{lambda} \\ &= 4458.3 \text{ meters} \end{aligned}$$

The maximum main beam power density in the Far Field can be determined from the following equation:(2)

$$\begin{aligned} \text{On-Axis Power Density in the Far Field, (Wf)} &= G_{es} * P / 4 * \pi * Rf^{**2} \\ &= 7.992 \text{ Watts/meters**2} \\ &= 0.799 \text{ mWatts/cm**2} \end{aligned}$$

2. Near Field Calculation

Power flux density is considered to be at a maximum value throughout the entire length of the defined Near Field region. The region is contained within a cylindrical volume having the same diameter as the antenna. Past the boundary of the Near Field region the power density from the antenna decreases linearly with respect to increasing distance.

The distance to the end of the Near Field can be determined from the following equation:(3)

$$\begin{aligned} \text{Extent of the Near Field, (Rn)} &= D^{**2} / (4 * \text{lambda}) \\ &= 1857.6 \text{ meters} \end{aligned}$$

The maximum power density in the Near Field can be determined from the following equation: (4)

$$\begin{aligned} \text{Near Field Power Density, (Wn)} &= 16.0 * n * P / \pi * D^{**2} \\ &= 18.657 \text{ Watts/meters**2} \\ &= 1.866 \text{ mWatts/cm**2} \end{aligned}$$

3. Transition Region Calculations

The Transition region is located between the Near and Far Field regions. The power density begins to decrease linearly with increasing distance in the Transition region. While the power density decreases **inversely** with distance in the Transition region, the power density decreases **inversely** with the square of the distance in the Far Field region. The maximum power density in the Transition region will not exceed that calculated for the Near Field region. The power density calculated in Section 1 is the highest power density the antenna can produce in any of the regions away from the antenna. The power density at a distance R_t can be determined from the following equation: (5)

$$\begin{aligned} \text{Transition region Power Density, (Tt)} &= W_n * R_n / R_t \\ &= 1.866 \text{ mWatts/cm}^2 \end{aligned}$$

4. Region between Main Reflector and Subreflector

Transmissions from the feed assembly are directed toward the subreflector surface, and are reflected back toward the main reflector. The most common feed assemblies are waveguide flanges, horns or subreflectors. The energy between the subreflector and the reflector surfaces can be calculated by determining the power density at the subreflector surface. This can be determined from the following equation: (6)

$$\begin{aligned} \text{Power Density at Feed Flange, (Ws)} &= 4 * P / A_s \\ &= 194.014 \text{ mWatts/cm}^2 \end{aligned}$$

5. Main Reflector Region

The power density in the main reflector is determined in the same manner as the power density at the subreflector. The area is now the area of the main reflector aperture and can be determined from the following equation: (7)

$$\begin{aligned} \text{Power Density at the Main Reflector Surface, (Wm)} &= 4 * P / A_m \\ &= 33.859 \text{ Watts/meters}^2; \\ &= 3.386 \text{ mWatts/cm}^2 \end{aligned}$$

6. Region between Main Reflector and Ground

Assuming uniform illumination of the reflector surface, the power density between the antenna and ground can be determined from the following equation: (8)

$$\begin{aligned} \text{Power Density between Reflector and Ground, (Wg)} &= P / A_g \\ &= 8.465 \text{ Watts/meter} \\ &= 0.846 \text{ mWatts/cm}^2 \end{aligned}$$

Table 4. Summary of 'Expected Radiation levels for Uncontrolled Environment

| <u>Region</u> | <u>Calculated Maximum Radiation Power Density Level (mWatts/cm**2)</u> | <u>Hazard Assessment</u> |
|---|--|--------------------------|
| 1. Far Field (Rf) = 4458.3 meters | 0.799 | Satisfies FCC MP |
| 2. Near Field (Rn) = 1857.6 meters | 1.866 | Potential Hazard |
| 3. Transition Region Rn < Rt < Rf, (Rt) | 1.866 | Potential Hazard |
| 4. Between Main Reflector and Subreflector . | 194.014 | Potential Hazard |
| 5. Main Reflector | 3.386 | Potential Hazard |
| 6. Between Main Reflector and Ground | 0.846 | Satisfies FCC ME |

Table 5. Summary of Expected Radiation levels for Controlled Environment

| <u>Region</u> | <u>Calculated Maximum Radiation Power Density Level (mWatts/cm**2)</u> | <u>Hazard Assessment</u> |
|---|--|--------------------------|
| 1. Far Field (Rf) = 4458.3 meters | 0.799 | Satisfies FCC M |
| 2. Near Field (Rn) = 1857.6 meters | 1.866 | Satisfies FCC M |
| 3. Transition Region Rn < Rt < Rf, (Rt) | 1.866 | Satisfies FCC M |
| 4. Between Main Reflector and Subreflector | 194.014 | Potential Hazard |
| 5. Main Reflector | 3.386 | Satisfies FCC M |
| 6. Between Main Reflector and Ground | 0.846 | Satisfies FCC M |

It is the applicant's responsibility to ensure that the public and operational personnel are not exposed to harmful levels of radiation.

7. Conclusions

Based upon the above analysis, it is concluded that during TT&C harmful levels of radiation may exist in those regions noted for the Uncontrolled (Table 4) Environment.

These transmissions are operational only short periods of time during emergency or testing situations. Those operational periods include TT&C functions, a transponder failure, or if a Transponder's performance is brought into question.

The earth station is installed at COMSAT Corporation's Paumalu, Hawaii Teleport facility. The complex is surrounded by a fence, which will restrict any public access. The earth station will be marked with the standard radiation hazard warnings, as well as the area in the vicinity of the earth stations to inform those in the general population, who might be working or otherwise present in or near the direct path of the main beams.

COMSAT Corporation will ensure that the main beam of the antenna will be pointed at least one diameter away from any building, or other obstacles in those areas that exceed the MPE levels.

Finally, the earth station's operating personnel will not have access to areas that exceed the MPE levels, while the earth station is in operation. The transmitter will be turned off during periods of maintenance, so that the MPE standard of 5.0 mW/cm^2 will be complied with for those regions in close proximity to the main reflector, which could be occupied by operating personnel.

EXHIBIT C

FAA NOTIFICATION

FM Notification Not Required

Per PART 17[17.14(a)] of the FCC rules, FAA notification is not required, as the proposed antenna structure will be located in an area with structures of equal or greater height.

1.0 Introduction

Interference calculations were performed to determine the potential for in-band and out-of-band interference from Radiolocation Systems operating in the 3.1 to 3.7 GHz band¹. The geographical positions and operating parameters of these systems was derived from NTIA Document TR-99-36².

2.0 Radiolocation Systems in the 3.1 – 3.7 GHz Band

High powered mobile and fixed radar systems operated by the Federal Government operate in the 3.1 – 3.7 GHz band. These radars are used to search for and track near-surface and high-altitude airborne projectiles, sea surveillance, and airborne objects. The NTIA report referenced above has identified the locations for two types of systems: land-based and shipboard based. Also included in the report are the operating characteristics of these radars. There are two prevalent types of shipboard radars, denoted as type A and Type B, and one type of ground-based radar. An Airborne System radar is also specified. This analysis will concern itself with interference from the ground based and shipboard based radars based upon the relative operating positions and parameters specified in the NTIA report

A summary of the operating parameters for the shipboard and ground based radar systems is shown below:

Table 1 – Technical Characteristics of 3.1-3.7 GHz Radiolocation Systems

| Characteristic | Shipboard System A | Shipboard System B | Ground Based System |
|-------------------------------|--------------------|--------------------|---------------------|
| Modulation | P0N | Q7N | P0N |
| Tuning Range (GHz) | 3.5-3.7 | 3.1-3.5 | 3.1-3.4 |
| Peak transmit Power (MW) | 1 | 4 | 0.12 |
| Pulse Width (µsec.) | 1.0 | 3.5-51.2 | 10.75 |
| Pulse Repetition Rate (kHz) | 1.125 | 0.152-6.0 | 2793.3-5050.51 |
| Duty Cycle (%) | 0.001 | 0.8-2.0 | 0.041 |
| Transmit 3-dB Bandwidth (MHz) | 4,16.6 | 4 | 1,10 |
| Antenna Type | Reflector | Phased Array | Phase Scan Array |
| Antenna Mainbeam Gain (dBi) | 32 | 42 | 36 |
| Antenna Centerline (m) | 46 | 20 | 46 |

4.0 Interference Calculations

The interference was **calculated into** the **earth** station receive system for both in-band and out-of-band interference. The **interference** power level was calculated using the formula **below**:

$$P_r = P_t + G_t - FSL - OHLOSS + G_{es} - LL_t - LL_{es}$$

Where:

P_r : Interference power level received at victim earth station, in **dB W**

P_t : Transmitter power of Radiolocation system, in **dBW**

G_t : Gain of Radiolocation transmit system, in **dB**

FSL: Free Space Loss between radiolocation system and earth station, in **dB**

OHLOSS: Over-the-Horizon losses between radiolocation system and earth station, in **dB**

G_{es} : Horizon gain of the earth station toward **radiolocation** transmitter, in **dB**

LL_t : Line losses of **the radiolocation** system, in **dB** (assume **2dB** per **NTIA** report)

LL_{es} : Line losses of the earth station system, in **dB** (assume **0 dB** unless known)

This interference power level was then **compared** to in-band and out-of-band interference criteria. The in-band criteria was developed using ITU and FCC recommendation³. The out-of-band interference **criteria** was developed using the following:

The earth station's low noise amplifier front-end overload criteria of was determined using the following calculations:

$$T = C - G$$

Where:

T = input threshold at which **front-end** overload occurs, **dBW**

C = output 1 **dB** gain compression point of the **LNA**, typical **-20 dB W**

G = Gain of the **LNA**, **dB**

For the purposes of this report it was assumed that the low-noise amplifier would not provide any **out-of-band** frequency rejection thus no Frequency Dependent Rejection values based upon any RF selectivity, such as pre-LNA filtering or inherent LNA filtering, have been assumed. The maximum level of interference is the includes the input saturation threshold value minus a 10 **dB** output backoff value to consider in operation levels

The maximum interference power receive, P_r , allowable then becomes:

$$\text{Max } P_r \geq T - \text{IPBO}$$

For a 65 **dB** gain LNA this value is **-95 dBW**. In the absence of manufacturer LNA/LNB specifications the following typical values have been used:

$$T = -95 \text{ dBW}$$

$$C = -20 \text{ dBW}$$

$$G = 65 \text{ dB}$$

The propagation model to determine the over-the-horizon loss is the NSMA OH-Loss model⁴. When the propagation link is very lengthy, over 250 miles, an estimated OH-loss using a rounded earth modeling value has been used.

³ FCC Rules 47CFR25.25 1 by reference ITU Radio Regulations Appendix S7.

⁴ National Spectrum Managers Association has developed an industry accepted version which incorporates NBS Tech Note 101.

5.0 Summary of Results

The summary calculations are shown for **all** shipboard based and land based **systems in** Tables 4 through **8** below. Whenever Radar A and B are possibly in use, **the** interference calculations have assumed the higher **powered** systems (Radar B). The antenna **elevation** for the Ground Based systems was assumed **to be 46** m even though it was not specified in **the** NTIA report.

Table Headings

- Radar Location : The site name of the radar system
- Lat (N) : Radar latitude
- Lon (w) : Radar Longitude
- Bearing (deg.) : Azimuth from earth station toward radar.
- Distance (mi) : Distance from earth station to radar
- Profile (Is path under 250 miles?) : If path is over 250 miles no OH-loss profile is generated
- FSL (dB) : Free Space Loss
- Estimated OH-Loss (dB) : Using a rounded-earth model an estimated OH-loss is calculated for long paths
- Profiled OH-Loss (dB) : Using the NSMA Tropo Loss actual OH-loss calculations are performed for shorter paths
- Total Path Loss (dB) : Total of Free Space Loss plus Over-the-Horizon loss
- Interfering Power Level (dBW/MHz) : Level of RF interference at the earth station's LNA input
- In-Band Interference? : If the Radar is operating in-band is the max. permissible interference criteria being met?
- Out-of Band Overload? : If the Radar is operating in out-of-band spectrum is the LNA overload threshold being met?

6.0 Conclusions

Calculations were performed to assess the electromagnetic compatibility (EMC) between the radars listed below and adjacent-band FSS earth station receiver at Paumalu, Hawaii. Interference assessment for Earth Stations Operating at 3625 - 3700 MHz at the Paumalu, HI site identified 15 cases of In-band potential interference. The applicant is aware of this potential for interference and will work with the Government Users to mitigate the problem.

Results

| Total Number of Paths 15 sites | | Lat (N) | Lon (W) | Out-of-Band Overload? | In-Band Interference? |
|-----------------------------------|----|---------|----------|--------------------------|--------------------------|
